

*Psidium guajava* L. (34418). **Guava.** Mr. H. H. Kolb, of Petersburg, Florida, reports: "The 3 guava plants sent me in 1904, were planted on what is commonly called flat land, of a good sandy loam. They made the most unusual growth of anything I have ever planted. They were given a small quantity of corn fertilizer about every three months, and were carefully watered whenever necessary. Two of these plants bloomed in May, 1915; the largest one had about 17 fruits, and the other about 6. The third one failed to bloom. Every one who tasted the fruit, pronounced it the finest they had ever known. The meat is a light pink, very thick, and the seed cavity is small. The fruit is pear-shaped and of very good size. Altogether it is without a doubt the finest guava ever grown. Of course these plants were given extraordinary care, but the result has been just as good."
